ROOM NO: 247

PROBLEM STATEMENT

ThavanAI is a **semi-autonomous** financial co-pilot that ingests messy real-world data, predicts cash crises before they hit, prioritizes obligations with deterministic logic enriched by **relationship intelligence**, and prepares everything the owner needs to act — with one tap.

HOW IT ACTUALLY WORKS?

1. Ingest Upload your bank statement (PDF) or photo a handwritten receipt. ThavanAI normalizes, deduplicates, and reads your cash position instantly.
2. Predict The engine scans the next 90 days — mapping every payable, receivable, GST liability, and informal buffer against your projected daily balance. It surfaces tight days before they hit.
3. Prioritize Every obligation gets a Priority Score based on urgency, relationship history, and payment flexibility. Your 8-year supplier scores differently than a new bank EMI — and the system knows it.
4. Escape For each tight day, ThavanAI generates ranked escape routes: request early payment, draw an informal loan, or delay a low-risk payable. Each option shows exactly how many runway days it buys you.
5. Act Pick an escape route. The system drafts the email or WhatsApp message for you — warm, personal, contextual. One tap sends it. Runway updates in real time.

INNOVATION AND UNIQUENESS

The problem with every existing tool — Tally, Zoho, Float — is they assume cash flow is invoice-based and linear. Indian SSI reality is the opposite. Consignments with no confirmed receivable date. Post-dated cheques that settle relationships but not cash. Bill discounting that creates double-counted receivables. LC-triggered payments that aren't flexible regardless of relationship. Seasonal inventory blocks that look like crises but aren't. No existing tool is built for this. ThavanAI is.

Key differentiators

Probabilistic runway
Receivables carry a confidence window, not a false date. You see a range, not a lie.

Instrument awareness
PDCs, LCs, discounted bills are each treated differently in the prediction engine. Not lumped as "receivable."

Relationship-weighted priorities
Your 8-year supplier and your new bank EMI are not the same obligation. Our scoring knows the difference.

Informal credit as infrastructure
The ₹25,000 you can call from a friend is a tracked liquidity buffer, surfaced as a real escape route when a crisis is detected.

Seasonal intent recognition
Diwali stock blocking doesn't trigger a false alarm. The engine distinguishes distress from strategy.

TECHNICAL ARCHITECTURE

FEASIBILITY AND VIABILITY

Feasibility

- Entire system runs as a single-page web app
- Core decision engine is pure deterministic logic
- AI used only for explanations and message drafts
- Can be built and demoed within 24 hours using standard web technologies (HTML, JS, React)
- Mock data replaces real financial input
- Modular phase structure means each feature works independently
- Predictive engine is simple date-based simulation

Viability

- Massive underserved market
- No direct competitor combines predictive cash flow + relationship intelligence + informal loans in one tool
- Low cost to operate
- GST compliance pressure on small businesses creates an urgent, recurring need for the product
- Accessible even in low-connectivity markets
- Can expand to WhatsApp-based input or voice in regional languages for deeper market penetration
- Builds trust through transparency
